4 Steps of Hosting

4.1 On Local Computer

Make sure to have NodeJS installed. Download the repository. In the repository open a terminal and enter `npm install`, followed by `node index.js`. Go to <http://localhost:5000> to see the app.

4.2 On Heroku

Detailed steps can be found in [4]. In short - install Heroku Toolbelt and log in your Heroku account from a terminal. On Heroku add a NodeJS app and add the app's git address as a remote to the code repository. Then push to the Heroku master branch.
